```

```
nodes = 1:6;
```

```
% Define edges with weights
```

```
edges = [

1 2 4;

1 3 2;

2 3 1;

targetNode = 6;

% Compute shortest path

[path, totalCost] = shortestpath(G, sourceNode, targetNode);

% Display path

disp('Optimal Path:');

disp(path);

disp(['Total Cost: ', num2str(totalCost)]);

```
```

## Step 3: Simulate Traffic and Data Flow

Once routes are established, simulate data packets traveling through the network:

```

```
hold on;

for i = 1:length(path)-1

    startNode = path(i);

    endNode = path(i+1);

    % Plot line representing the packet moving

    plot([G.Nodes.X(startNode), G.Nodes.X(endNode)], ...

        [G.Nodes.Y(startNode), G.Nodes.Y(endNode)], 'ro-');

Implementing Network Routing Simulation in MATLAB: Step-by-Step

Let's walk through a typical process of setting up a routing simulation in MATLAB.

Step 1: Creating the Network Topology

Start by defining network nodes and links. MATLAB's graph objects make this straightforward:

```
```matlab

% Define adjacency matrix

adjMatrix = [

0 1 0 0 1;

1 0 1 0 0;

0 1 0 1 0;

0 0 1 0 1;

1 0 0 1 0

];

% Create graph object

G = graph(adjMatrix);

plot(G, 'EdgeLabel', G.Edges.Weight);

```
```

This code constructs a simple undirected network with weighted links, which can be customized for more complex topologies.

Step 2: Implementing Routing Algorithms

For shortest path routing, Dijkstra's algorithm is commonly used. MATLAB's graph object provides built-in functions:

```
```matlab

% Compute shortest path from node 1 to node 5

[startNode, endNode] = deal(1, 5);

[path, totalCost] = shortestpath(G, startNode, endNode);

disp(['Path: ', mat2str(path)]);

disp(['Total cost: ', num2str(totalCost)]);

```
```

For dynamic routing protocols or more sophisticated algorithms, custom functions can be developed, leveraging MATLAB's capabilities to update link costs based on traffic or failures.

Step 3: Simulating Traffic and Data Transmission

Generate traffic patterns and simulate packet traversal:

```
```matlab

% Sample traffic source

numPackets = 100;

destNode = 5; % Destination node

for i = 1:numPackets

 sourceNode = randi([1, size(G.Nodes,1)]);

 [path, ~] = shortestpath(G, sourceNode, destNode);

 % Log the path and simulate delays

end
```

% Additional code can model packet delays and loss

end

```

This simulation can be extended to incorporate queuing, bandwidth constraints, and packet loss modeling.

Step 4: Analyzing Performance

Collect data during simulation to evaluate key metrics:

```matlab

% Example: calculating average path length

pathLengths = [];

for each simulated packet

pathLength = length(path) - 1; % Number of hops

pathLengths(end+1) = pathLength;

end

avgHops = mean(pathLengths);

disp(['Average number of hops: ', num2str(avgHops)]);

```

Similarly, delays and throughput can be analyzed using statistical methods and MATLAB's visualization tools.

Understanding the Genesis and Rationale Behind Halabi Routing Architecture

The rapid expansion of the Internet in the 1990s exposed significant challenges in existing routing architectures, notably issues related to scalability, management complexity, and fault tolerance. Traditional flat routing architectures, such as those used in early IP networks, faced limitations in handling the growing number of networks and routes.

Key drivers for developing the Halabi Architecture included:

- Scalability Constraints: As the number of networks increased, routing tables became unmanageable, leading to increased memory and processing requirements.
- Routing Instability: Frequent changes in topology caused widespread route flaps, affecting network stability.
- Management Complexity: Flat routing models complicated network management, troubleshooting, and policy implementation.
- Desire for Hierarchical Design: To mitigate these issues, a hierarchical approach was deemed necessary, enabling better route aggregation and simplified management.

The core idea was to introduce a structured hierarchy that could scale with the Internet's growth while maintaining efficient routing and policy control.

Core Principles of the Halabi Internet Routing Architecture

The architecture is built upon several foundational principles that collectively aim to improve routing efficiency and scalability.

1. Hierarchical Routing Structure
